

PIZZA SALES PERFORMANCE REPORT

A Data Analytics Portfolio Project

Prepared by: NS

Tools Used: Microsoft Excel, SQL, Power BI

Reporting Period Covered: January 2025 – December 2025

September 2026

1. Executive Summary

This report presents a complete analysis of one year of pizza sales transactions (January to December 2025) for a pizza restaurant business, using Microsoft Excel/CSV data preparation, SQL for KPI and aggregate calculation, and Power BI for interactive dashboard visualization. The purpose of the analysis is to evaluate overall sales performance, understand customer ordering behavior, and identify which products, categories, and sizes are driving revenue — in order to support data-driven decisions on menu strategy, staffing, and promotions.

Across the year, the business processed 21,334 orders totaling \$817,621.80 in revenue, selling 49,559 pizzas at an average order value of \$38.32 and an average of 2.32 pizzas per order. Revenue was fairly evenly split across the four pizza categories (Classic, Supreme, Chicken, and Veggie), while Large pizzas alone generated 45.9% of all revenue — by far the dominant size. July was the strongest month of the year (\$72,557.90) and October the weakest (\$64,027.60), a swing of roughly 12% between the best and worst months. Thursday was the busiest day of the week for orders, while Saturday was the quietest, an unusual pattern for a food-service business that is worth investigating further.

The Thai Chicken Pizza was the single highest revenue-generating product, while The Classic Deluxe Pizza led on both order frequency and total quantity sold. The Brie Carre Pizza was consistently the weakest performer across every metric — revenue, orders, and quantity — making it the clearest candidate on the menu for review. The dataset does not include cost, profit margin, or individual customer information, so this analysis focuses on revenue, order volume, and product/category/size performance rather than profitability or customer segmentation; this scope is noted explicitly throughout the report rather than estimated.

Key opportunities identified include: promoting Large and Medium pizzas more aggressively given their outsized share of revenue; using cross-sell strategies to lift the relatively modest average of 2.32 pizzas per order; reviewing staffing and promotional cadence around the Thursday peak and Saturday dip in order volume; and reassessing or repositioning the small number of consistently underperforming menu items such as The Brie Carre Pizza. Overall, the Power BI dashboard built for this project gives stakeholders a single, interactive view of sales performance that would otherwise require manually cross-referencing spreadsheets and SQL query output.

2. Business Problem

Pizza restaurants generate a high volume of small, frequent transactions across a wide product catalog (32 distinct pizzas, across 4 categories and 5 sizes). Without a consolidated reporting tool, it is difficult for management to answer basic but important operational questions: Which months and days require the most staffing? Which pizzas should be promoted or retired? Is the menu's size mix (Small through XXL Large) aligned with what customers actually order?

The Pizza Sales Performance Dashboard built in this project addresses that problem by consolidating a full year of order-level transaction data into a single interactive Power BI report. It allows stakeholders to:

- Monitor overall sales performance through headline KPIs (revenue, orders, pizzas sold, order value, basket size).
- Track monthly revenue trends to spot seasonal peaks and troughs.
- Compare order volume by day of the week to inform staffing and scheduling.

- Compare performance across pizza categories (Classic, Supreme, Chicken, Veggie) and sizes (S, M, L, XL, XXL).
- Identify the best- and worst-performing individual pizzas by revenue, orders, and quantity sold.
- Filter and drill down interactively rather than relying on static, one-off spreadsheet reports.

3. Project Objectives

- Analyze one full year of pizza sales transactions to understand overall business performance.
- Calculate and monitor core sales KPIs: total revenue, total orders, total pizzas sold, average order value, and average pizzas per order.
- Identify monthly revenue trends and day-of-week ordering patterns.
- Compare revenue and volume across pizza categories and sizes.
- Identify the top- and bottom-performing pizzas by revenue, order count, and quantity sold.
- Build an interactive Power BI dashboard with slicers for year, category, and size so stakeholders can explore the data themselves.
- Translate the analysis into concrete, actionable business recommendations.

4. Dataset Overview

The analysis is based on a single transactional dataset, PIZZA.csv (also modeled in SQL as the PIZZA_SALES table), containing order-line-level detail for every pizza sold during the reporting period.

Attribute	Detail
Total records (rows)	48,606 order lines
Total columns	12
Time period covered	01 January 2025 – 31 December 2025 (full calendar year)
Grain of the data	One row per pizza sold within an order
Distinct orders	21,334
Distinct pizza products (menu items)	32
Pizza categories	4 – Classic, Supreme, Chicken, Veggie
Pizza sizes	5 – Small, Medium, Large, XLarge, XXLarge

Key fields in the dataset and how they support the analysis:

- order_id – groups multiple pizza line items into a single customer order; used to calculate total orders, average order value, and average pizzas per order.
- order_date / order_time – used to build the monthly revenue trend and the day-of-week order volume analysis.
- quantity, unit_price, total_price – numeric fields used for all revenue and volume calculations.
- pizza_size, pizza_category, pizza_name – categorical fields used to segment performance by size, category, and individual product.
- pizza_ingredients – descriptive text field, used for context only and not part of the numeric analysis.

The dataset does not contain a customer identifier, loyalty/membership field, cost or profit data, or a store/region field. As a result, this report does not include customer-level segmentation, profit margin analysis, or regional comparisons — sections of a typical performance report that would rely on data not present here. Where the standard reporting structure calls for these, they have been substituted with the closest equivalent that the data does support (for example, pizza size in place of region, and order volume/day-of-week patterns in place of customer-level trends).

5. Data Preparation

Before analysis, the raw transaction data was reviewed and validated using the following steps:

- Reviewed the full dataset structure (48,606 rows, 12 columns) to confirm it matched the intended PIZZA_SALES schema.
- Checked for missing values across all 12 columns — none were found; the dataset is complete with no nulls.
- Checked for duplicate order-line records — none were found.
- Verified data types: quantity and price fields as numeric, order_date as a date field, order_time as a time field, and pizza_size/pizza_category/pizza_name as text/categorical fields.
- Standardized and reviewed column names (pizza_id, order_id, pizza_name_id, quantity, order_date, order_time, unit_price, total_price, pizza_size, pizza_category, pizza_ingredients, pizza_name) for consistency before loading into SQL and Power BI.
- Validated numerical fields by cross-checking that total_price consistently equals quantity × unit_price.
- Confirmed the order_date field spans a complete, contiguous 12-month period (Jan–Dec 2025) with no gaps.
- Loaded the cleaned dataset into a SQL table (PIZZA_SALES) to calculate KPIs and aggregate views, which were then connected to Power BI for visualization.

6. Key Performance Indicators

The dashboard's KPI cards summarize overall performance for the full year:

KPI	Value	What it measures / why it matters
Total Revenue	\$817,621.80	Total sales generated across all orders — the top-line measure of business performance.
Total Orders	21,334	Number of distinct customer transactions — indicates overall customer traffic/demand.
Total Pizzas Sold	49,559	Total units sold — measures sales volume independent of price.
Average Order Value	\$38.32	Revenue per order — a proxy for basket size and pricing effectiveness.
Average Pizzas per Order	2.32	Number of items per transaction — indicates cross-sell/upsell behavior.

Note: The dataset does not include cost data, so a Profit or Profit Margin KPI could not be calculated and is not presented; similarly, no unique-customer identifier is available, so a Total Customers KPI is not included. Both

are flagged here rather than estimated, consistent with the requirement to base all figures strictly on the provided data.

Interpretation: With an average order value of \$38.32 and 2.32 pizzas per order, the typical customer is ordering just over two pizzas per visit — close to "one for me, one to share" behavior. This is a reasonable baseline but also represents a clear opportunity: modest increases in items-per-order (through bundling or upsizing prompts) would have an outsized effect on total revenue given the order volume of over 21,000 transactions per year.

7. Revenue Analysis

7.1 Monthly Revenue Trend

Month	Revenue
January	\$69,776.60
February	\$65,159.60
March	\$70,397.10
April	\$68,736.80
May	\$71,238.20
June	\$68,210.00
July	\$72,557.90
August	\$68,262.20
September	\$64,180.00
October	\$64,027.60
November	\$70,374.60
December	\$64,701.20

Revenue is relatively stable throughout the year, fluctuating within a fairly narrow band of roughly \$64K to \$72.6K per month — about a 12% spread between the strongest and weakest months. July was the strongest month (\$72,557.90), followed by May (\$71,238.20) and March (\$70,397.10). October was the weakest month (\$64,027.60), closely followed by September (\$64,180.00) and December (\$64,701.20). The data does not show a single dominant seasonal driver (e.g. a clear summer or holiday spike); rather, performance dips modestly in the early autumn (September–October) and picks back up in November before easing again in December. Because the dataset covers only one calendar year, this pattern should be treated as an observation rather than a confirmed recurring seasonal trend, and would benefit from being re-checked against a second year of data.

8. Order Volume & Day-of-Week Analysis

The dataset does not include profit or per-customer data, so this section — in place of a traditional profit-by-region analysis — examines order volume patterns by day of the week, which is directly supported by the data and highly relevant for staffing and operations planning.

Day	Total Orders
Monday	2,972
Tuesday	3,024
Wednesday	3,238
Thursday	3,535
Friday	3,158
Saturday	2,624
Sunday	2,793

Thursday is the busiest day of the week by a clear margin (3,535 orders), followed by Wednesday (3,238) and Friday (3,158). Saturday is, notably, the quietest day (2,624 orders), with Sunday (2,793) and Monday (2,972) also below the weekly average. This midweek-heavy, weekend-light pattern is somewhat atypical for a food-service business and represents a genuine opportunity area: management should investigate whether this reflects the true nature of demand (e.g. a workplace-lunch-driven customer base) or whether weekend demand is being constrained by staffing, hours, or lack of promotion.

9. Product Performance Analysis

9.1 Top 5 Pizzas by Revenue

Pizza	Revenue
The Thai Chicken Pizza	\$43,434.25
The Barbecue Chicken Pizza	\$42,730.50
The California Chicken Pizza	\$41,388.75
The Classic Deluxe Pizza	\$38,164.50
The Spicy Italian Pizza	\$34,818.75

9.2 Bottom 5 Pizzas by Revenue

Pizza	Revenue
The Brie Carre Pizza	\$11,588.50
The Green Garden Pizza	\$13,943.75
The Spinach Supreme Pizza	\$15,277.75
The Mediterranean Pizza	\$15,360.50
The Spinach Pesto Pizza	\$15,562.75

9.3 Top 5 Pizzas by Orders and by Quantity Sold

The Classic Deluxe Pizza leads on both order frequency and total quantity sold, indicating it is the most consistently chosen item on the menu even though three chicken pizzas generate more total revenue individually (likely reflecting a higher price point on those items).

Pizza	Total Orders	Total Quantity Sold
The Classic Deluxe Pizza	2,328	2,452
The Hawaiian Pizza	2,280	2,422
The Pepperoni Pizza	2,278	2,418
The Barbecue Chicken Pizza	2,271	2,430
The Thai Chicken Pizza	2,225	2,371

The Brie Carre Pizza is the clear laggard across every product metric measured — lowest revenue (\$11,588.50), fewest orders (480), and lowest quantity sold (490) — making it the single clearest candidate on the menu for a pricing review, recipe refresh, repositioning, or removal.

10. Category Performance Analysis

Category	Revenue	% of Total Revenue
Classic	\$219,997.10	26.91%
Supreme	\$208,131.00	25.46%
Chicken	\$195,848.50	23.95%
Veggie	\$193,645.20	23.68%

Revenue is spread almost evenly across the four categories, with only a 3.2-percentage-point gap between the strongest (Classic, 26.91%) and weakest (Veggie, 23.68%). This balance suggests the current menu mix is well diversified and no single category is carrying the business — but it also means there is no standout category to double down on; growth is more likely to come from within-category product performance (see Section 9) and from the size mix (see Section 11) than from shifting emphasis between categories.

11. Pizza Size Performance Analysis

The dataset does not include a region or store field, so — in place of a regional performance comparison — this section analyzes performance by pizza size, which is fully supported by the data and is one of the four interactive filters on the dashboard.

Size	Revenue	% of Total Revenue
Large	\$375,215.45	45.89%
Medium	\$249,333.50	30.49%
Small	\$177,990.25	21.77%

Size	Revenue	% of Total Revenue
XLarge	\$14,076.00	1.72%
XXLarge	\$1,006.60	0.12%

Large pizzas alone generate almost half of all revenue (45.89%), and Large plus Medium together account for over three-quarters of revenue (76.38%). XLarge and XXLarge sizes are essentially niche, combining for under 2% of revenue — and notably, XLarge and XXLarge sizes are only offered within the Classic category (552 and 28 units respectively), with no oversized options at all for Chicken, Supreme, or Veggie pizzas.

11.1 Total Pizzas Sold by Size and Category

Category	Large	Medium	Small	XLarge	XXLarge
Chicken	4,930	3,893	2,223	0	0
Classic	4,057	4,110	6,137	552	28
Supreme	4,562	4,046	3,375	0	0
Veggie	5,402	3,583	2,661	0	0

Classic is the only category with meaningful Small-size volume (6,137 units, well above any other category/size combination), suggesting Classic pizzas are disproportionately chosen for individual or budget-conscious orders. This is a candidate for a targeted bundle or lunch-set offer built around Classic pizzas in Small size.

12. Monthly Sales Trend Analysis

Building on the revenue-by-month data in Section 7.1: the highest-performing month was July (\$72,557.90) and the lowest-performing was October (\$64,027.60), a difference of roughly \$8,530 (about 13% of the low month's value). No single quarter is uniformly strong or weak — Q1 (Jan–Mar) and Q2 (Apr–Jun) perform similarly to Q3 (Jul–Sep), while Q4 (Oct–Dec) is the softest quarter overall, driven mainly by October and December. Because only one year of data is available, this should be read as a single-year observation rather than a confirmed seasonal pattern; a second year of data would be needed to confirm whether the September–October softening and July peak repeat annually.

13. Power BI Dashboard Overview

The dashboard, titled “Pizza Sales Performance Report,” is a single-page, fully interactive Power BI report built on the cleaned PIZZA_SALES data. It combines five KPI cards, six charts, and three interactive slicers into one view. A full-page screenshot of the dashboard is shown below, followed by a breakdown of each element and the business question it answers.

Figure 1. Pizza Sales Performance Power BI Dashboard — full view with all KPI cards, charts, and slicers.

KPI Cards (Total Revenue, Total Orders, Total Pizza Sold, Avg. Pizza per Order, Avg. Order Value)

What it shows: At-a-glance headline metrics for the full year (or for whatever slicer selection is active).

Business question answered: “How is the business performing overall, right now?”

How a stakeholder can use it: Gives management a one-glance health check before drilling into any other visual, and updates instantly as filters are applied.

Monthly Revenue Trend (line/column chart, Jan–Dec)

What it shows: Total revenue for each month of the year.

Business question answered: “Which months are strong or weak, and is revenue trending up, down, or flat?”

How a stakeholder can use it: Lets stakeholders spot the July peak and the September/October dip and plan promotions or staffing around them.

Orders by Day of Week (column chart, Mon–Sun)

What it shows: Total distinct orders placed on each day of the week across the year.

Business question answered: “Which days are busiest, and which are quietest?”

How a stakeholder can use it: Directly informs staff scheduling and helps decide which days need marketing pushes (e.g. Saturday).

Sales Distribution by Category (donut/pie chart, %)

What it shows: Share of total revenue contributed by each of the four pizza categories.

Business question answered: “Which type of pizza brings in the most revenue?”

How a stakeholder can use it: Shows the near-even split between Classic, Supreme, Chicken, and Veggie, supporting balanced menu investment decisions.

Sales Distribution by Pizza Size (donut/pie chart, %)

What it shows: Share of total revenue contributed by each of the five sizes.

Business question answered: “What size are customers actually buying?”

How a stakeholder can use it: Highlights the dominance of Large and Medium sizes, useful for portion planning, pricing, and promotional sizing offers.

Total Pizza Sold by Size & Category (clustered column chart)

What it shows: Units sold, broken down jointly by size and category.

Business question answered: “Within each category, what size mix are customers ordering?”

How a stakeholder can use it: Surfaces patterns like Classic's unusually high Small-size volume, useful for category-specific promotions.

Total Revenue by Pizza Name (bar chart, top items)

What it shows: Revenue generated by each individual pizza (menu item).

Business question answered: “Which specific pizzas are the biggest revenue drivers?”

How a stakeholder can use it: Identifies hero products (e.g. The Thai Chicken Pizza) worth protecting and promoting in marketing.

Top / Worst Pizza by Revenue, Orders, and Quantity Sold (single-value cards)

What it shows: The single best- and worst-performing pizza on each of three metrics.

Business question answered: “What are our single best and worst menu items, and by which measure?”

How a stakeholder can use it: Gives an immediate, unambiguous answer for menu-planning conversations without needing to read a full ranked list.

Slicers: Year, Category, Size

What it shows: Interactive filters that let the user narrow every visual on the page to a specific year, category, or size.

Business question answered: “How does performance look for just Chicken pizzas, or just Large pizzas, or a specific year?”

How a stakeholder can use it: Turns the dashboard from a static report into a self-service exploration tool for any stakeholder, without needing a new report built for each question.

14. Key Business Insights

Insight 1

Finding: Revenue is nearly evenly split across the four pizza categories, with just a 3.2-point gap between the strongest (Classic, 26.91%) and weakest (Veggie, 23.68%).

Business Impact: No category is a clear underperformer, so category-level cuts are unlikely to help; growth needs to come from within-category product and size decisions instead.

Recommended Action: Focus optimization efforts at the individual-product and size level rather than reallocating investment between categories.

Insight 2

Finding: Large pizzas alone generate 45.89% of total revenue, and Large plus Medium together account for over three-quarters (76.38%) of revenue, while XLarge and XXLarge combined contribute under 2%.

Business Impact: The business is heavily reliant on mid-to-large sizes; the oversized tier is effectively a niche offering that adds menu complexity for minimal return.

Recommended Action: Promote Large/Medium sizing in marketing and combos, and evaluate whether continuing to stock XLarge/XXLarge (offered only within Classic) is worth the operational overhead.

Insight 3

Finding: The average order contains 2.32 pizzas and is worth \$38.32, indicating most customers order for roughly two people.

Business Impact: Even a small lift in items-per-order, applied across 21,334 annual orders, would meaningfully increase total revenue without needing to attract a single new customer.

Recommended Action: Introduce or promote multi-pizza bundle pricing and “add a second pizza” prompts at checkout to push basket size above the current 2.32 average.

Insight 4

Finding: July was the peak revenue month (\$72,557.90) while October was the lowest (\$64,027.60), a roughly 13% gap, with September and December also trailing the yearly average.

Business Impact: Revenue is not flat across the year; the early-autumn dip (Sep–Oct) represents lost revenue relative to the rest of the year.

Recommended Action: Plan a targeted promotion or menu refresh for September and October to close the gap, and monitor whether the pattern repeats in a second year of data.

Insight 5

Finding: Thursday is the busiest day for orders (3,535) while Saturday is the quietest (2,624) — an unusual midweek-heavy, weekend-light pattern for a food business.

Business Impact: Current staffing or marketing may not be aligned with actual weekly demand, and weekend revenue may be underdeveloped.

Recommended Action: Investigate the cause of the weekend dip (hours, staffing, competition, or promotion) and consider a weekend-specific offer to lift Saturday and Sunday volume.

Insight 6

Finding: The Thai Chicken Pizza is the single highest revenue-generating item (\$43,434.25), ahead of two other chicken pizzas (Barbecue Chicken, California Chicken) in the top five by revenue.

Business Impact: Chicken-category items, despite Chicken being only the third-largest category overall by revenue share, punch above their weight at the individual product level.

Recommended Action: Feature the top chicken pizzas prominently in marketing and ensure their ingredient supply chain is prioritized to avoid stockouts.

Insight 7

Finding: The Classic Deluxe Pizza leads the menu in both total orders (2,328) and total quantity sold (2,452), even though it ranks fourth in total revenue.

Business Impact: It is the most habitually reordered item on the menu — a reliable volume driver rather than a high-ticket item.

Recommended Action: Protect this item's recipe and pricing consistency, since it likely plays an outsized role in customer retention and repeat visits.

Insight 8

Finding: The Brie Carre Pizza is the weakest performer on every measured metric: lowest revenue (\$11,588.50), fewest orders (480), and lowest quantity sold (490).

Business Impact: It is the clearest single underperformer on the menu, consistently trailing the rest of the catalog rather than being weak on just one dimension.

Recommended Action: Review pricing, recipe, and menu placement for The Brie Carre Pizza, and consider a limited-time relaunch or replacement if performance does not improve.

Insight 9

Finding: Classic is the only category with a meaningful volume of Small-size pizzas sold (6,137 units), far above any other size/category combination in the dataset.

Business Impact: There appears to be a distinct budget- or single-serving-oriented customer segment that gravitates specifically toward Classic pizzas.

Recommended Action: Consider a Classic-branded small/lunch combo to capture this segment more deliberately rather than leaving it to occur organically.

Insight 10

Finding: XLarge and XXLARGE sizes exist only within the Classic category and together represent under 2% of total revenue and under 1% of units sold.

Business Impact: The oversized tier is a narrow, low-volume niche rather than a broad-based offering, which may not justify menu and inventory complexity across all categories.

Recommended Action: Evaluate whether to retire, simplify, or actively promote the XLarge/XXLarge Classic options depending on their margin contribution (not measurable from this dataset, but worth investigating operationally).

15. Business Recommendations

- Lean into Large and Medium sizing in promotions and combo pricing, since these two sizes already generate over three-quarters of total revenue.
- Design a bundle or 'add a second pizza' prompt aimed at lifting the average of 2.32 pizzas per order, given the high annual order volume of 21,334.
- Investigate and address the Thursday-high / Saturday-low order pattern through staffing adjustments and a weekend-focused promotion.
- Plan a September–October promotion or limited-time offer to close the roughly 13% gap between the peak month (July) and the lowest month (October).
- Feature top revenue drivers — The Thai Chicken Pizza, The Barbecue Chicken Pizza, and The California Chicken Pizza — prominently in marketing and ensure ingredient availability.
- Protect The Classic Deluxe Pizza's recipe, pricing, and availability, given its role as the single most frequently ordered item on the menu.
- Conduct a focused review of The Brie Carre Pizza — the weakest item across revenue, orders, and quantity — including potential recipe refresh, repricing, or removal.
- Consider a Classic-branded small/individual combo to capture the budget-oriented segment reflected in Classic's unusually high Small-size volume.
- Reassess the XLarge/XXLarge Classic-only size tier, which contributes under 2% of revenue, to determine whether it is worth the added menu and inventory complexity.
- Continue tracking these KPIs monthly through the Power BI dashboard, and revisit the seasonal and weekly patterns once a second year of data is available to confirm they recur.

16. Conclusion

Over the course of 2025, the business generated \$817,621.80 in revenue across 21,334 orders and 49,559 pizzas sold, with a stable, moderately fluctuating monthly revenue pattern and a well-diversified category mix. The clearest performance signals in the data are structural rather than seasonal: a strong dependence on Large and Medium sizes, a modest but improvable basket size of 2.32 pizzas per order, an atypical midweek-heavy order pattern, and a small set of consistently strong (Thai Chicken, Classic Deluxe) and consistently weak (Brie Carre) menu items.

None of these findings point to an underlying problem with the business; rather, they highlight specific, addressable levers — basket size, weekend demand, and a handful of underperforming menu items — that can be acted on without a fundamental change in strategy. The main risk to monitor is the September–October revenue softening, which should be re-examined once additional years of data are available to confirm whether it is a recurring seasonal effect.

The Power BI dashboard built for this project turns what would otherwise require several manual SQL queries and spreadsheet cross-references into a single interactive view, letting stakeholders filter by year, category, or size and get an immediate answer to day-to-day performance questions — supporting faster, more confident, and more frequent data-driven decisions.

17. Portfolio Project Summary

Project Name: Pizza Sales Performance Report

Tools Used: Microsoft Excel, SQL, Power BI

Business Objective: Analyze one year of pizza sales transactions to evaluate overall sales performance, order behavior, and product/category/size performance, and present the findings through an interactive Power BI dashboard.

Key Analysis: Cleaned and validated a 48,606-row transactional dataset; calculated core KPIs (revenue, orders, pizzas sold, average order value, average pizzas per order) using SQL; analyzed monthly revenue trends, day-of-week order patterns, category and size performance, and top/worst-performing individual products; built a single-page interactive Power BI dashboard with year, category, and size slicers.

Key Findings: Revenue is evenly spread across categories but heavily concentrated in Large and Medium sizes (76% of revenue); July is the peak month and October the low point; order volume peaks midweek (Thursday) and dips on Saturday; The Thai Chicken Pizza and The Classic Deluxe Pizza are the strongest performers, while The Brie Carre Pizza consistently underperforms across every metric.

Business Value: The dashboard replaces manual spreadsheet and SQL cross-referencing with a single interactive report, enabling faster identification of underperforming products, better-informed staffing and promotional timing, and ongoing self-service monitoring of core sales KPIs.

18. Skills Demonstrated

- Microsoft Excel / CSV data handling
- Data Cleaning & Validation
- SQL (data modeling, aggregation, KPI queries, ranking/top-N analysis)
- Data Preparation
- Exploratory Data Analysis
- Power BI (dashboard development, DAX-driven KPI cards, slicers)
- Data Visualization
- KPI Development
- Business Analysis
- Interactive Reporting
- Data Storytelling
- Business Insights & Recommendations
- Data-Driven Decision Making
